Overview

- Stochastic Multi-Armed Bandit Problem
- **Problem Definition**
- Contribution
- **Previous Works**
- **AugUCB**
- Theoretical Analysis
- **Experiments**
- Conclusion

 The thresholding bandit problem falls under the broad area of stochastic multi-armed bandit problem.

- The thresholding bandit problem falls under the broad area of stochastic multi-armed bandit problem.
- A finite set of actions or arms belonging to set A such that |A| = K.

- The thresholding bandit problem falls under the broad area of stochastic multi-armed bandit problem.
- A finite set of actions or arms belonging to set A such that |A| = K.
- The rewards for each of the arms are identical and independent random variables drawn from distribution specific to the arm.

- The thresholding bandit problem falls under the broad area of stochastic multi-armed bandit problem.
- A finite set of actions or arms belonging to set A such that |A| = K.
- The rewards for each of the arms are identical and independent random variables drawn from distribution specific to the arm.
- The learner does not know the mean r_i , $\forall i \in A$ of the distribution or the variance σ_i^2 .

 The distributions for each of the arms are fixed throughout the time horizon denoted by T.

- The distributions for each of the arms are fixed throughout the time horizon denoted by T.
- The estimated reward $\hat{r}_i = \frac{1}{n_i} \sum_{z=1}^{n_i} X_{i,z}$.

- The distributions for each of the arms are fixed throughout the time horizon denoted by T.
- The estimated reward $\hat{r}_i = \frac{1}{n_i} \sum_{z=1}^{n_i} X_{i,z}$.
- The more we pull arm i the closer \hat{r}_i gets to r_i .

- The distributions for each of the arms are fixed throughout the time horizon denoted by T.
- The estimated reward $\hat{r}_i = \frac{1}{n_i} \sum_{z=1}^{n_i} X_{i,z}$.
- The more we pull arm *i* the closer \hat{r}_i gets to r_i .
- Due to the uncertainty in \hat{r}_i we have to carefully conduct exploration.

• **Primary aim:** Identify the arms whose mean of the reward distribution (r_i) is above a particular threshold τ given as input.

- **Primary aim:** Identify the arms whose mean of the reward distribution (r_i) is above a particular threshold τ given as input.
- Condition: This has to be achieved within T timesteps of exploration and this is termed as a fixed-budget problem.

- **Primary aim:** Identify the arms whose mean of the reward distribution (r_i) is above a particular threshold τ given as input.
- Condition: This has to be achieved within T timesteps of exploration and this is termed as a fixed-budget problem.
- At the end of the given T timesteps the learner must recommend a set of arms which (according to it) are the arms having reward mean above τ .

• We define the set $S_{\tau} = \{i \in \mathcal{A} : r_i \geq \tau\}.$

- We define the set $S_{\tau} = \{i \in \mathcal{A} : r_i \geq \tau\}$.
- S_{τ}^{c} denote the complement of S_{τ} , i.e., $S_{\tau}^{c} = \{i \in \mathcal{A} : r_{i} < \tau\}$.

- We define the set $S_{\tau} = \{i \in \mathcal{A} : r_i \geq \tau\}.$
- S_{τ}^{c} denote the complement of S_{τ} , i.e., $S_{\tau}^{c} = \{i \in \mathcal{A} : r_{i} < \tau\}$.
- Let \hat{S}_{τ} denote the recommendation of a learning algorithm after T time units of exploration, while \hat{S}_{τ}^{c} denotes its complement.

- We define the set $S_{\tau} = \{i \in \mathcal{A} : r_i \geq \tau\}.$
- S_{τ}^{c} denote the complement of S_{τ} , i.e., $S_{\tau}^{c} = \{i \in A : r_{i} < \tau\}$.
- Let \hat{S}_{τ} denote the recommendation of a learning algorithm after T time units of exploration, while \hat{S}_{τ}^{c} denotes its complement.
- The goal of the learning agent is to minimize the expected loss:

$$\mathbb{E}[\mathcal{L}(T)] = \mathbb{P}\big(\underbrace{\{\mathcal{S}_{\tau} \cap \hat{\mathcal{S}}_{\tau}^{\textit{C}} \neq \emptyset\}}_{\text{Rejected good arms}} \ \cup \underbrace{\{\hat{\mathcal{S}}_{\tau} \cap \mathcal{S}_{\tau}^{\textit{C}} \neq \emptyset\}}_{\text{Accepted bad arms}}\big)$$

Challenges in the TBP Settings

 Closer the true mean of reward distribution of the arms' to the threshold ⇒ harder the problem.

Challenges in the TBP Settings

- Closer the true mean of reward distribution of the arms' to the threshold ⇒ harder the problem.
- Lesser the budget ⇒ harder the problem.

Challenges in the TBP Settings

- Closer the true mean of reward distribution of the arms' to the threshold ⇒ harder the problem.
- Lesser the budget ⇒ harder the problem.
- Higher the variance of reward distribution of the arms' ⇒ harder the problem.

Applications

 Selecting the best channels (out of several existing channels) for mobile communications in a very short duration whose qualities are above an acceptable threshold (see Audibert and Bubeck (2010)).

Applications

- Selecting the best channels (out of several existing channels) for mobile communications in a very short duration whose qualities are above an acceptable threshold (see Audibert and Bubeck (2010)).
- Selecting a small set of best workers (out of a very large pool of workers) whose productivity is above a threshold.

Applications

- Selecting the best channels (out of several existing channels) for mobile communications in a very short duration whose qualities are above an acceptable threshold (see Audibert and Bubeck (2010)).
- Selecting a small set of best workers (out of a very large pool of workers) whose productivity is above a threshold.
- In anomaly detection and classification (see Locatelli et al. (2016)).

 We propose the Augmented UCB (AugUCB) [Mukherjee et al. (2017)] algorithm for the fixed-budget TBP setting.

- We propose the Augmented UCB (AugUCB) [Mukherjee et al. (2017)] algorithm for the fixed-budget TBP setting.
- AugUCB takes into account the empirical variances of the arms along with mean estimates.

- We propose the Augmented UCB (AugUCB) [Mukherjee et al. (2017)] algorithm for the fixed-budget TBP setting.
- AugUCB takes into account the empirical variances of the arms along with mean estimates.
- It is the first variance-based arm elimination algorithm for the considered TBP settings.

- We propose the Augmented UCB (AugUCB) [Mukherjee et al. (2017)] algorithm for the fixed-budget TBP setting.
- AugUCB takes into account the empirical variances of the arms along with mean estimates.
- It is the first variance-based arm elimination algorithm for the considered TBP settings.
- It addresses an open problem discussed in Auer and Ortner (2010) of designing an algorithm that can eliminate arms based on variance estimates.

- We propose the Augmented UCB (AugUCB) [Mukherjee et al. (2017)] algorithm for the fixed-budget TBP setting.
- AugUCB takes into account the empirical variances of the arms along with mean estimates.
- It is the first variance-based arm elimination algorithm for the considered TBP settings.
- It addresses an open problem discussed in Auer and Ortner (2010) of designing an algorithm that can eliminate arms based on variance estimates.
- We also define a new problem complexity which uses empirical variance estimates along with arm's mean for giving the theoretical bound

The Upper Confidence Bound (UCB) Approach

• Since there is an initial uncertainty in the estimated mean (\hat{r}_i) introduce a confidence interval term c_i .

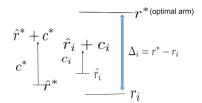

The Upper Confidence Bound (UCB) Approach

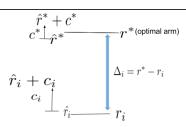

- Since there is an initial uncertainty in the estimated mean (\hat{r}_i) introduce a confidence interval term c_i .
- c_i represents the uncertainty about \hat{r}_i . Higher the c_i , higher is the uncertainty.
- c_i ensures that the arm i is properly explored and is gradually reduced with time as one pulls the arm i more.

The Upper Confidence Bound (UCB) Approach

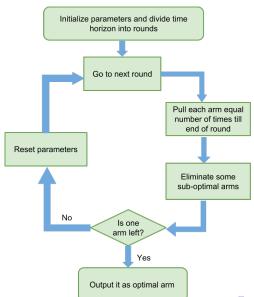

- Since there is an initial uncertainty in the estimated mean (\hat{r}_i) introduce a confidence interval term c_i .
- c_i represents the uncertainty about \hat{r}_i . Higher the c_i , higher is the uncertainty.
- c_i ensures that the arm i is properly explored and is gradually reduced with time as one pulls the arm i more.
- At every timestep pull arm $j \in \arg\max_{i \in A} \{\hat{r}_i + c_i\}$ and this will ensure that proper exploration is done.

The UCB Approach

Approach of UCB-Improved (UCB-Imp)

Intuition of UCB-Improved (UCB-Imp)

APT Approach

• The Anytime Parameter Free (APT) [Locatelli et al. (2016)] algorithm was proposed for TBP setting in ICML 2016.

APT Approach

- The Anytime Parameter Free (APT) [Locatelli et al. (2016)] algorithm was proposed for TBP setting in ICML 2016.
- ullet This algorithm uses only mean estimation to find the $\mathcal{S}_{\tau}.$

APT Approach

- The Anytime Parameter Free (APT) [Locatelli et al. (2016)] algorithm was proposed for TBP setting in ICML 2016.
- This algorithm uses only mean estimation to find the S_{τ} .
- Theoretically they proved this algorithm to be almost optimal when only mean estimation is used as a metric of comparison.

APT Approach

- The Anytime Parameter Free (APT) [Locatelli et al. (2016)] algorithm was proposed for TBP setting in ICML 2016.
- This algorithm uses only mean estimation to find the S_{τ} .
- Theoretically they proved this algorithm to be almost optimal when only mean estimation is used as a metric of comparison.
- Empirically it outperformed other state-of-the-art algorithms which were modified to perform in the TBP setting.

APT Algorithm

Algorithm 1 APT

Input: Time horizon T, threshold τ , tolerance factor $\epsilon \geq 0$ Pull each arm once

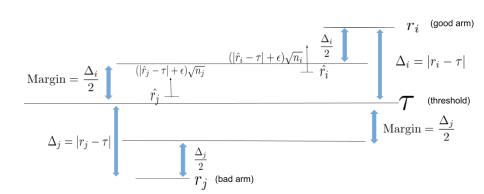

for
$$t = K + 1, ..., T$$
 do

Pull arm $j \in \arg\min_{i \in A} \left\{ (|\hat{r}_i - \tau| + \epsilon) \sqrt{n_i} \right\}$ and observe the reward for arm j.

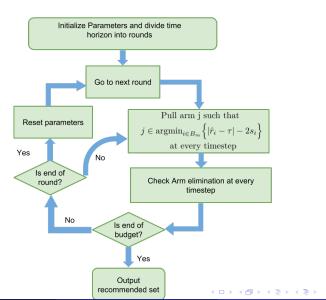

end for

Output: $\hat{S}_{\tau} = \{i : \hat{r}_i \geq \tau\}.$

Intuition of APT

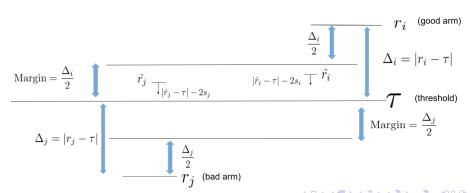

AugUCB algorithm

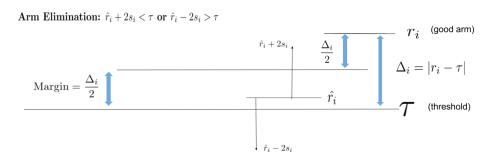

AugUCB algorithm (Intuition, Arm pulling)

- Like UCB-Imp, AugUCB also divides the time budget T into rounds.
- At every timestep we pull arm j s.t. $j \in \arg\min_{i \in B_m} \left\{ |\hat{r}_i \tau| 2s_i \right\}$ (like APT).

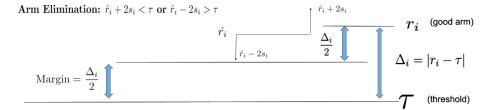

AugUCB algorithm (Intuition, Arm Elimination)

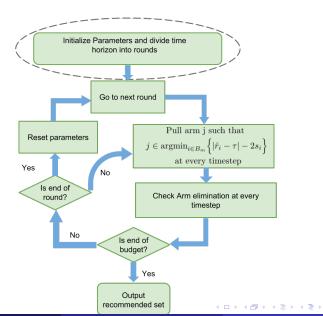

- It is risky to eliminate arm i while \hat{r}_i is inside Margin.
- Confidence interval s_i will make sure arm i is not eliminated while inside Margin with a high probability.

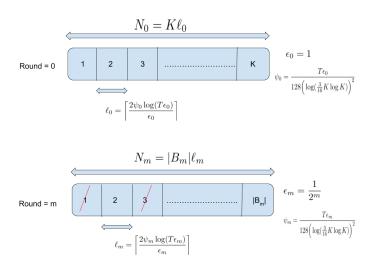

AugUCB algorithm (Intuition, Arm Elimination)

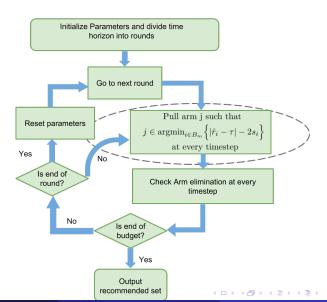

AugUCB parameter initialization

Parameter initialization

AugUCB arm pull

ullet We pull the arm that minimizes $j\in rg \min_{i\in B_m}\left\{|\hat{r}_i- au|-2s_i
ight\}$

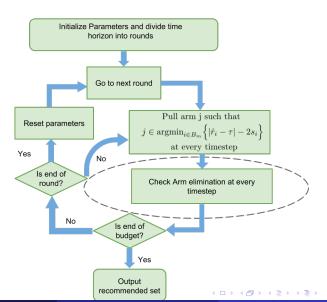

- ullet We pull the arm that minimizes $j\in rg\min_{i\in B_m}\left\{|\hat{ au}_i- au|-2s_i
 ight\}$
- We define the confidence interval $s_i = \sqrt{\frac{\rho \psi_m(\hat{v}_i+1) \log(T\epsilon_m)}{4n_i}}$.

- ullet We pull the arm that minimizes $j\in rg\min_{i\in B_m}\left\{|\hat{ au}_i- au|-2s_i
 ight\}$
- We define the confidence interval $s_i = \sqrt{rac{
 ho\psi_m(\hat{v}_i+1)\log(T\epsilon_m)}{4n_i}}$.
- s_i decreases with more n_i and ψ_m and ρ ensures that it decreases at a correct rate.

- ullet We pull the arm that minimizes $j\in rg\min_{i\in B_m}\left\{|\hat{ au}_i- au|-2s_i
 ight\}$
- We define the confidence interval $s_i = \sqrt{rac{
 ho\psi_m(\hat{v}_i+1)\log(T\epsilon_m)}{4n_i}}$.
- s_i decreases with more n_i and ψ_m and ρ ensures that it decreases at a correct rate.
- Note that \hat{v}_i estimated variance in s_i makes the algorithm pull the arm which shows more variance.

AugUCB arm elimination

Arm elimination

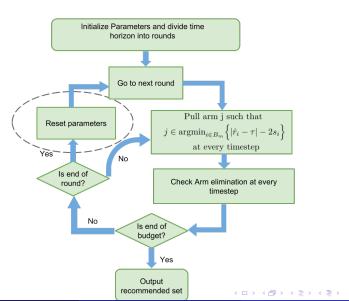

• Arm elimination condition is checked at every timestep.

Arm elimination

- Arm elimination condition is checked at every timestep.
- It eliminated arm which are above or below margin.

Arm elimination

- Arm elimination condition is checked at every timestep.
- It eliminated arm which are above or below margin.
- Re-allocates the remaining budget for surviving arms.

• Increase the allocated pulls ℓ_m for each surviving arms.

- Increase the allocated pulls ℓ_m for each surviving arms.
- Proportionally reduce the exploration factor ψ_m for next round.

- Increase the allocated pulls ℓ_m for each surviving arms.
- Proportionally reduce the exploration factor ψ_m for next round.
- Recalculate the length of next round on the number of surviving arms.

• We have defined $\Delta_i = |\tau - r_i|$.

- We have defined $\Delta_i = |\tau r_i|$.
- We define $H_1 = \sum_{i=1}^K \frac{1}{\Delta_i^2}$ and $H_2 = \min_{i \in \mathcal{A}} \frac{i}{\Delta_{(i)}^2}$ where $\Delta_{(i)}$ is an increasing ordering of Δ_i .

- We have defined $\Delta_i = |\tau r_i|$.
- We define $H_1 = \sum_{i=1}^K \frac{1}{\Delta_i^2}$ and $H_2 = \min_{i \in \mathcal{A}} \frac{i}{\Delta_{(i)}^2}$ where $\Delta_{(i)}$ is an increasing ordering of Δ_i .
- From Audibert and Bubeck (2010) the relationship between H₁ and H₂ can be derived as,

$$H_2 \leq H_1 \leq \log(2K)H_2$$

• For a variance aware algorithm we define $H_{\sigma,1}$ (as in Gabillon et al. (2011)) that incorporates reward variances into its expression as:

$$H_{\sigma,1} = \sum_{i=1}^K rac{\sigma_i + \sqrt{\sigma_i^2 + (16/3)\Delta_i}}{\Delta_i^2}.$$

• For a variance aware algorithm we define $H_{\sigma,1}$ (as in Gabillon et al. (2011)) that incorporates reward variances into its expression as:

$$H_{\sigma,1} = \sum_{i=1}^K rac{\sigma_i + \sqrt{\sigma_i^2 + (16/3)\Delta_i}}{\Delta_i^2}.$$

• Finally, analogous to H_2 , we introduce $H_{\sigma,2}$, such that $H_{\sigma,2} = \max_{i \in \mathcal{A}} \frac{i}{\tilde{\Delta}_{(i)}^2}$, where $\tilde{\Delta}_i^2 = \frac{\Delta_i^2}{\sigma_i + \sqrt{\sigma_i^2 + (16/3)\Delta_i}}$, $(\tilde{\Delta}_{(i)})$ is an increasing ordering of $(\tilde{\Delta}_i)$.

• For a variance aware algorithm we define $H_{\sigma,1}$ (as in Gabillon et al. (2011)) that incorporates reward variances into its expression as:

$$H_{\sigma,1} = \sum_{i=1}^K rac{\sigma_i + \sqrt{\sigma_i^2 + (16/3)\Delta_i}}{\Delta_i^2}.$$

- Finally, analogous to H_2 , we introduce $H_{\sigma,2}$, such that $H_{\sigma,2}=\max_{i\in\mathcal{A}}rac{i}{ ilde{\Delta}_{i,0}^2}$, where $ilde{\Delta}_i^2=rac{\Delta_i^2}{\sigma_i+\sqrt{\sigma_i^2+(16/3)\Delta_i}}$, $(ilde{\Delta}_{(i)})$ is an increasing ordering of $(\tilde{\Delta}_i)$.
- From Audibert and Bubeck (2010), we can show that

$$H_{\sigma,2} \leq H_{\sigma,1} \leq \log(2K)H_{\sigma,2}$$
.

30 / 37

• For a variance aware algorithm we define $H_{\sigma,1}$ (as in Gabillon et al. (2011)) that incorporates reward variances into its expression as:

$$H_{\sigma,1} = \sum_{i=1}^K rac{\sigma_i + \sqrt{\sigma_i^2 + (16/3)\Delta_i}}{\Delta_i^2}.$$

- Finally, analogous to H_2 , we introduce $H_{\sigma,2}$, such that $H_{\sigma,2}=\max_{i\in\mathcal{A}}rac{i}{ ilde{\Delta}_{i,0}^2}$, where $ilde{\Delta}_i^2=rac{\Delta_i^2}{\sigma_i+\sqrt{\sigma_i^2+(16/3)\Delta_i}}$, $(ilde{\Delta}_{(i)})$ is an increasing ordering of $(\tilde{\Delta}_i)$.
- From Audibert and Bubeck (2010), we can show that

$$H_{\sigma,2} \leq H_{\sigma,1} \leq \log(2K)H_{\sigma,2}$$
.

• Note that H_1 , H_2 and $H_{\sigma,1}$, $H_{\sigma,2}$ are not directly comparable to each other except in a special case when variances and gaps (Δ_i) are very low we can say that $H_{\sigma,1} < H_1$.

Expected Loss of AugUCB

Theorem

For $K \ge 4$ and $\rho = 1/3$, the expected loss of the AugUCB algorithm is given by.

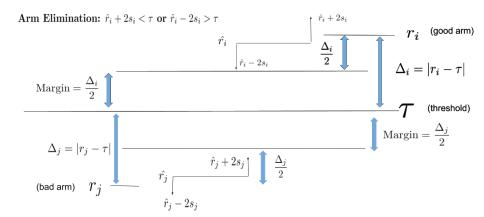

$$\mathbb{E}[\mathcal{L}(T)] \leq 2KT \exp\bigg(-\frac{T}{4096\log(K\log K)H_{\sigma,2}}\bigg).$$

Table: AugUCB vs. State of the art

Algorithm	Upper Bound on Expected Loss		Oracle
AugUCB	exp ($\left(-\frac{T}{4096\log(K\log K)H_{\sigma,2}} + \log(2KT)\right)$	No
UCBEV	exp ($\left(-\frac{1}{512}\frac{T-2K}{H_{\sigma,1}}+\log\left(6KT\right)\right)$	Yes
APT	exp ($\left(-\frac{T}{64H_1} + 2\log((\log(T) + 1)K)\right)$	No
UCBE	exp ($\left(-\frac{T-K}{18H_1}-2\log(\log(T)K)\right)$	Yes

Sketch of the proof

• We compare with APT, AugUCB, UCBE, UCBEV, UA.

- We compare with APT, AugUCB, UCBE, UCBEV, UA.
- Note that UCBE and UCBEV require access to H_1 and $H_{\sigma,1}$ as input and hence not implementable in real life.
- By access we mean that an oracle supplies them the H_1 or $H_{\sigma,1}$. They do not have access to individual means and variances.

- We compare with APT, AugUCB, UCBE, UCBEV, UA.
- Note that UCBE and UCBEV require access to H_1 and $H_{\sigma,1}$ as input and hence not implementable in real life.
- By access we mean that an oracle supplies them the H_1 or $H_{\sigma,1}$. They do not have access to individual means and variances.
- APT, AugUCB, UA do not require access to H_1 or $H_{\sigma,1}$.

- We compare with APT, AugUCB, UCBE, UCBEV, UA.

- By access we mean that an oracle supplies them the H_1 or $H_{\sigma,1}$. They do not have access to individual means and variances.
- APT, AugUCB, UA do not require access to H_1 or $H_{\sigma,1}$.
- UCBE, UCBEV, CSAR and UA come from the pure exploration lineage and are modified suitably to perform in TBP setting.

Experimental Setup

• This setup involves Gaussian reward distributions with $K=100,\,T=10000$ and $\tau=0.5$ with the reward means set in two groups.

Experimental Setup

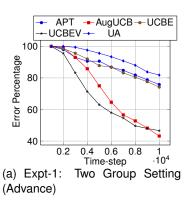

- This setup involves Gaussian reward distributions with K=100, T=10000 and $\tau=0.5$ with the reward means set in two groups.
- The first 10 arms partitioned into two groups; the respective means are $r_{1:5} = 0.45$, $r_{6:10} = 0.55$.

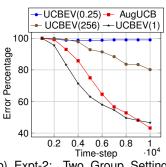

Experimental Setup

- This setup involves Gaussian reward distributions with K=100, T=10000 and $\tau=0.5$ with the reward means set in two groups.
- The first 10 arms partitioned into two groups; the respective means are $r_{1.5} = 0.45$, $r_{6.10} = 0.55$.
- The means of arms i = 11 : 100 are chosen same as $r_{11:100} = 0.4$.
- Variances are set as $\sigma_{1.5}^2 = 0.3$ and $\sigma_{6.10}^2 = 0.8$; $\sigma_{11.100}^2$ are independently and uniformly chosen in the interval [0.2, 0.3].

Experimental Results

(b) Expt-2: Two Group Setting (Advance)

Conclusion

- We proposed the AugUCB algorithm for the fixed budget TBP which uses variance estimation and arm elimination to give an improved theoretical and experimental guarantees than APT.
- This work has been accepted in the proceedings of IJCAI 2017. I thank my collaborator Dr. K.P. Naveen for guiding me through this work.

Conclusion

- We proposed the AugUCB algorithm for the fixed budget TBP which uses variance estimation and arm elimination to give an improved theoretical and experimental guarantees than APT.
- This work has been accepted in the proceedings of IJCAI 2017. I thank my collaborator Dr. K.P. Naveen for guiding me through this work.
- Further studies are required to establish a lower bound on the expected loss of AugUCB.

Conclusion
